

Progress Towards the Linear Collider in Germany

Santa Cruz Linear Collider Retreat

June 27th - 29th 2002

- What is new at TTF?
- Status of TESLA
- European Steering Committee
- Evaluation in Germany

(For technology aspects see talks by G. Dugan and H. Weise)

Albrecht Wagner

DESY and University of Hamburg

TESLA: One Year after TDR

The poster for the TESLA Colloquium features a background image of sailboats on water. At the top left is the TESLA logo. At the top right, it reads "500 - 800 GeV e^+e^- Linear Collider with an X-Ray Free Electron Laser Laboratory". The main title "Colloquium" is in a large serif font, followed by "Scientific Perspectives and Technical Realisation of TESLA" in a smaller serif font. The dates "23 / 24 March, 2001" and the location "DESY Hamburg, Germany" are in the bottom right. A small image of a colorful rainbow-like particle detector is also visible. Three yellow text boxes are overlaid on the poster, containing the following text:

Has attracted world-wide attention to LC and XFEL

World-wide consensus on LC as next project

Wide agreement on international realisation

TESLA triggered multiple international activities in the field of SASE lasers

The TESLA Test Facility

Construction of a prototype accelerator:

Tasks:

Test of all components

Operation for > 13 000 h

Base for costing

Conclusion:

The technical readiness has been demonstrated

TTF Operation for Experiments and Beam Studies

Overview of TTF Operation from August 2001 to May 2002:

Total hours of operation: **4080**

Beam Uptime = hours allocated to the users, accelerator studies, and overall tuning: **89%** (after October 2001)

FEL experiments
14.01.02 - 20.01.02

Linac studies
11.02.02 - 17.02.02

SC Linac as Base for an X-FEL

Self
Amplified
Spontaneous
Emission
(Kondratenko,
Saldin 1980)

$\log(\text{radiation power})$

- Spont. Emission
- for certain wave lengths, fulfilling a resonance condition

→ lasing

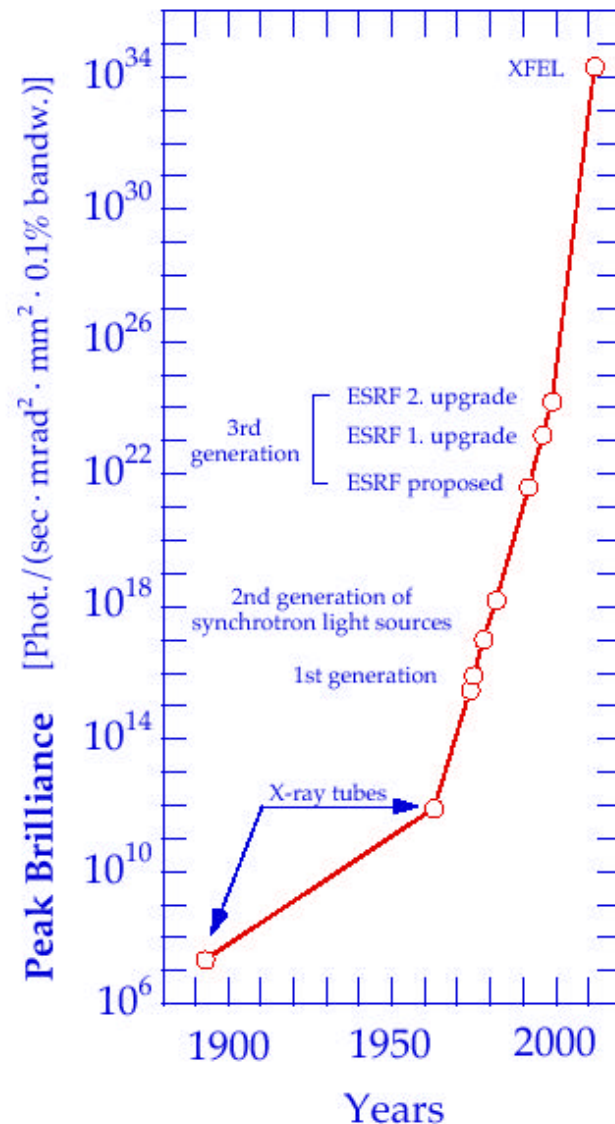

Albrecht W

requires small emittance electron beam

Properties of the X-ray Laser

- Wavelength of atomic dimensions
> 0.1 nm
- Highest brilliance
~ 10⁹ times that of sources of the 3. generation
- Very short pulselength
100 fs
- Tunable in wavelength
- Coherence

Synchrotron radiation power P of an incoherent electron distribution: $P \sim N_e$

Radiation from a point charge (bunch length $< \lambda_{\text{radiation}}$): $P \sim N_e^2$

Gain: $\sim N_e = 10^9 \dots 10^{10}$

Scientific Applications of a 0.1 nm Laser

The applications make use of the
different features of the laser

- Atomic and molecular physics
- Biology
- Chemistry
- Material science
- High field- and plasma physics

movies of chemical reactions

real-time studies of formation of
condensed matter

imaging of bio-molecular assemblies
with atomic resolution

Albrecht Wagner, Santa Cruz, June 2002

Key role for pump-and-probe
experiments

Properties of the Laser

All measured properties of the laser agree with the theoretical predictions, e.g. saturation (gain: $10 \cdot 10^6$)

by far the most brilliant VUV light source world-wide

Tunability and Coherence

$$I \propto 1/E^2$$

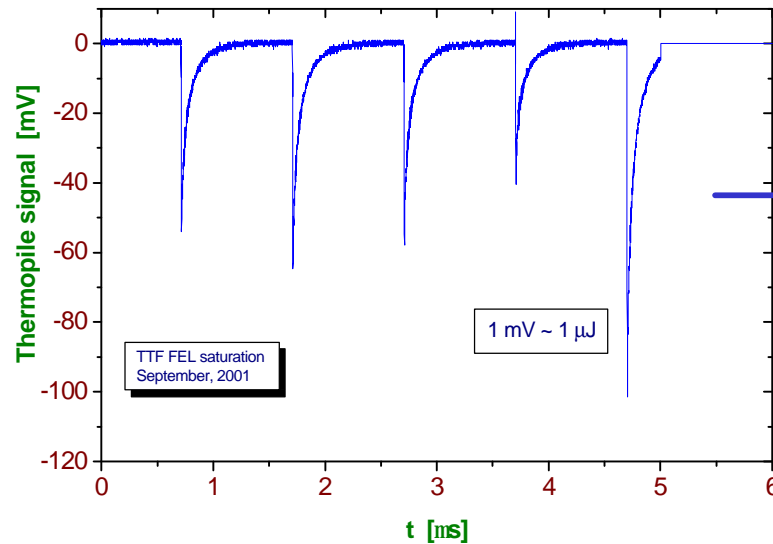

→ Transverse coherence

Also seen in opening angle of radiation at saturation

Slit distance: 3 mm

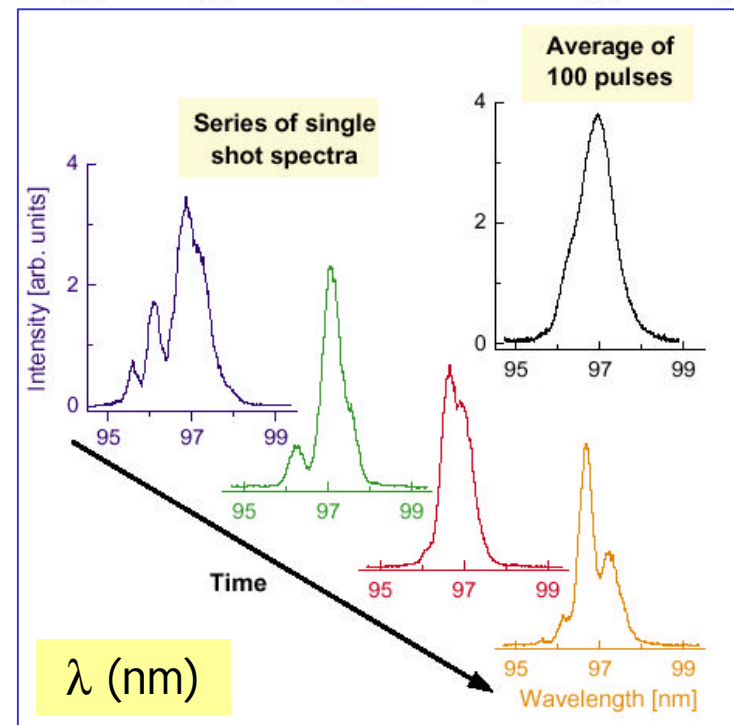

Fluctuation properties of SASE radiation at TTF

Energy fluctuation in saturation
< 20%

Measured spectrum → agrees with simulated spectrum, based on measured fluctuations of pulse energy

First Experiments at TTF

Interaction of Intense Radiation (100 nm) with Matter

Measurement of

- multi-photon processes
- cross sections
- life time of intermediate states
- Coulomb explosion

as function of intensity

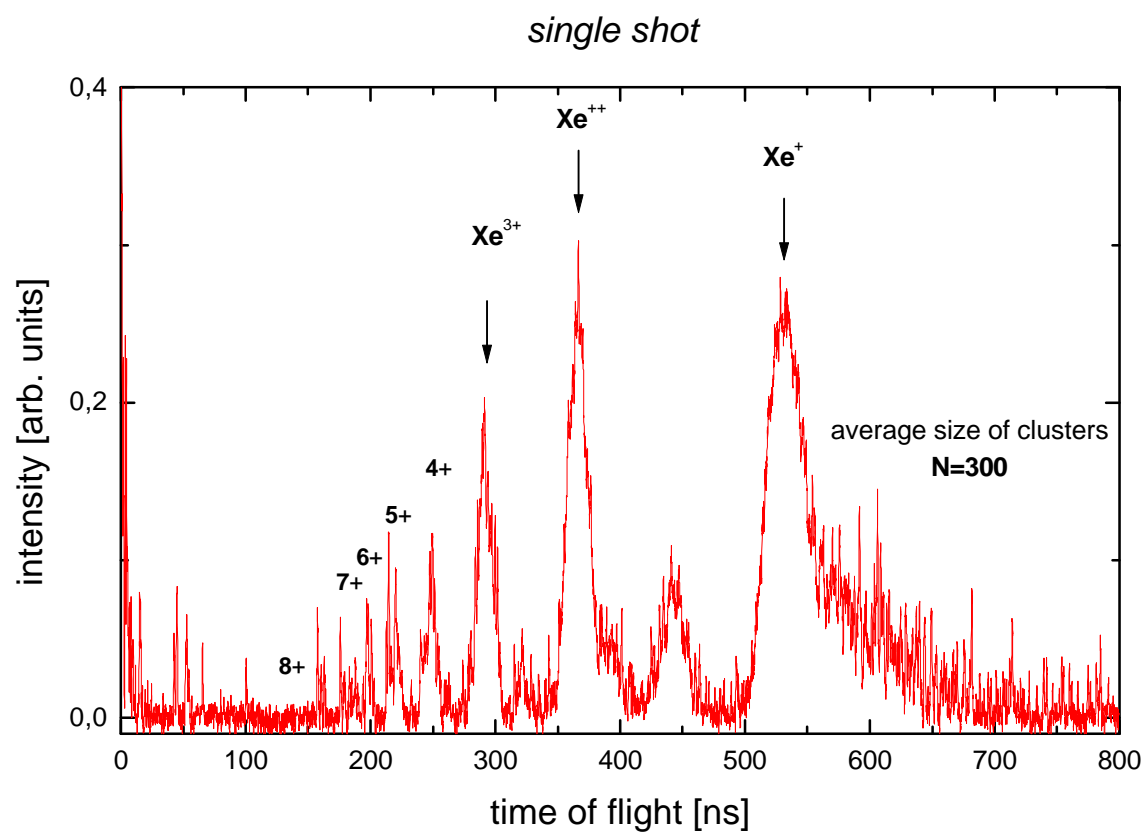

First Results

(Th.Möller et al.)

Cluster-Ion Detector

$$I p_{\text{Xe}} = 12.1 \text{ eV}$$
$$E_{\text{phot}} = 12.8 \text{ eV}$$

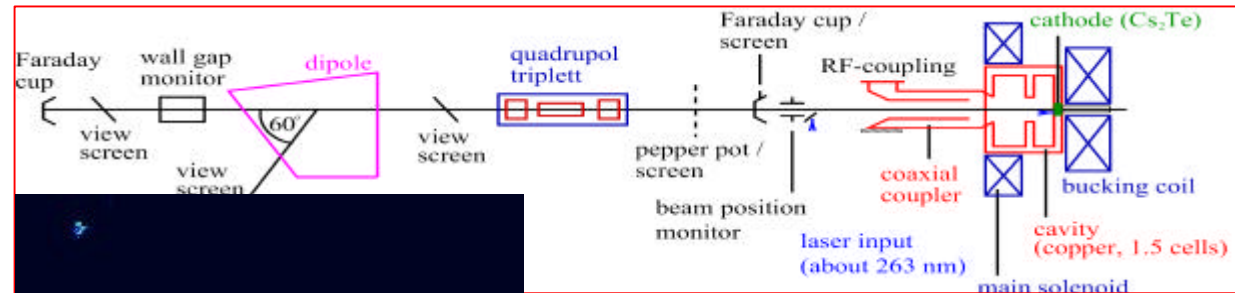

The Photo-Injector in Zeuthen

In collaboration with
BESSY, MBI, TUD

Start of operation on
30 January 2002

Experience at TTF1
have again underlined
the key importance of
the RF gun
development

TTF Full Performance Test

Goal:

Operate module close to TESLA specifications and for long period

One module with gradients of close to 23 MV/m (TDR: 23.4 MV/m)

Run RF with 5 Hz (TDR: 5 Hz)

Run with long pulse trains: 800 μ s, > 3 nC/bunch (TDR: 3.2 nC)

High Gradient & Full Beam Loading

Module #3 quench limit: 22.7 MV/m

Total time of run: 49 days (18.03.02 - 05.05.02)

Module operation at 5Hz: 39 days (~ 19.5 MV/ m)

Module operation at 1Hz: 4 days (~ 20.0 MV/ m)

Module operation at 1Hz: 6 days (~ 21.5 MV/ m)

~ 5 % below quench limit

The up time of the module was about 90 % average during the test.

Down time never due to the module itself.

No difference in cavity performance with and without beam.

Next Steps at TTF

At present TTF is being reconfigured (until July):

- Install **one new module** which reaches the TESLA design gradient of 23.4 MV/m
- Test of one **'superstructure'** (higher cavity packing density)

Run TTF from July to November to gain further experience with these systems

Then **reconfigure for TTF2**, a 1 GeV VUV FEL and LC test bed.

TTF2 VUV FEL

Freie-Elektronen Laser
Experimentierhalle

Transport Tunnel

TTF1 will be extended to
reach 1 GeV in 2003
and become a user facility
in 2004

TESLA Test Facility

TTF1

X-FEL Layout

TDR:

Collider and FEL use **jointly** the first section of the SC linac.

Following the recommendation by the Science Council, the **planning is** based on **separate linac** for X-FEL, using same technology and infrastructure

Spectral distribution covered by TESLA

Status of TESLA

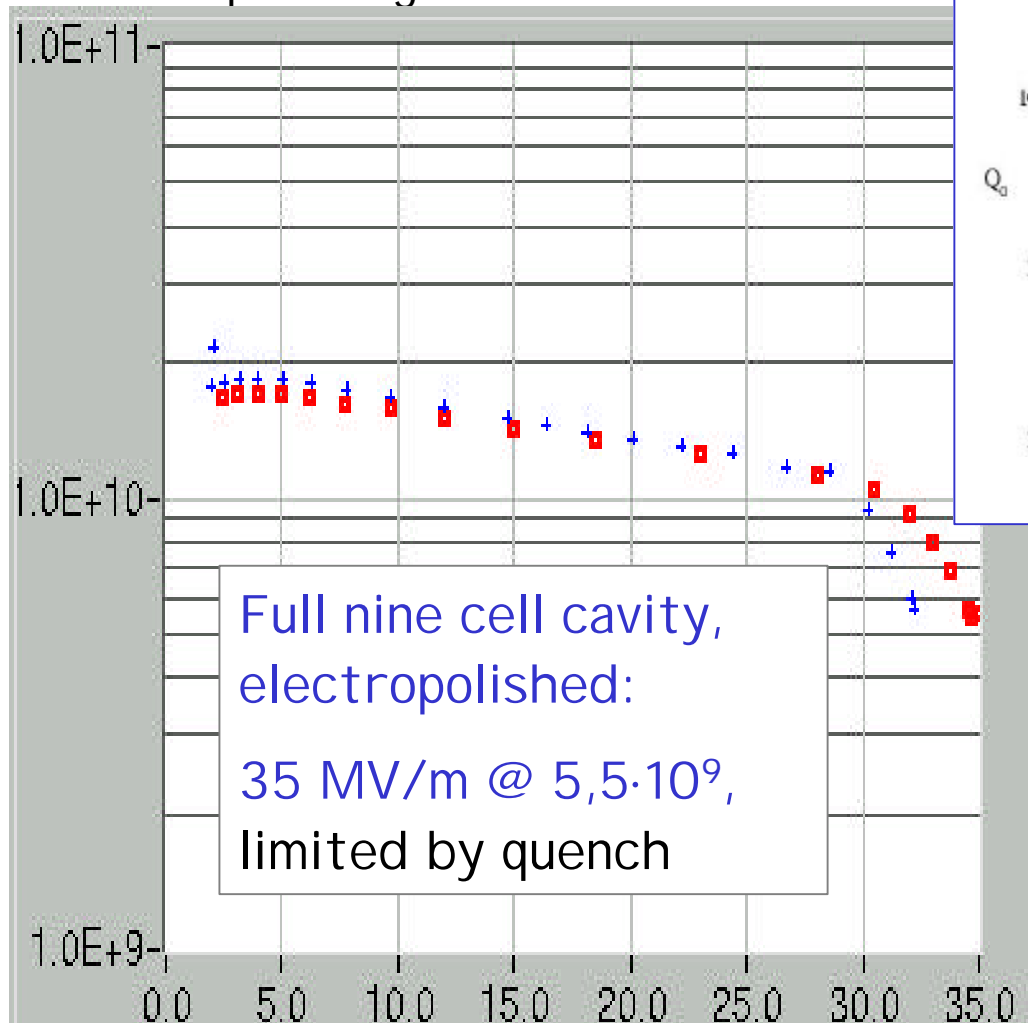

Major new results:

- Free Electron Laser works as user facility with high efficiency
- Promising development of cavities (gradient of gradient)
- High gradient operation of TTF works well
- Progress in ongoing other R&D (e.g. RF coupler, photoinjector)
- Improved theoretical understanding and tools
- Much better understanding of implementation issues
(2. I R, separate laser linac, hall lay out...)
- New TESLA working groups: Commissioning, Risk and Reliability

On the Way to 35 MV/m

Improvement of surface quality with electro-polishing

Transition from single-cell results to multi-cell results has again been successful

Speed of progress presently limited by manpower and availability of infrastructure

TESLA Energy Strategy

TDR (March 2001)

Base line design for 500 GeV, upgrade possibility outlined

- initially operate at an energy of about 500 GeV, to explore the Higgs and related phenomena, and then
- increasing the energy to 800-1,000 GeV, to more fully explore the TeV energy scale.

Assuming that cavities will reach 35 MV/m:

Cost and Time

Cost evaluation based on TTF prices and studies by industry (2000 prices)

Construction time: 8 years, Funding time: 10 years

Personnel:

7000 person years

1) 500 GeV Linear Collider with 1 experimental area

3136 MEuro

2) Incremental cost for X-FEL and laboratory

531 MEuro

3) One detector for particle physics

210 MEuro

Sum

3877 MEuro

Annual cost during construction

400 ME/year

Cost **shared** between partners

Civil engineering would be host responsibility

546 ME

Review of Cost

Review of costing by groups from Japan, US

The two reviews did not attempt to fully validate the cost, but rather the method of the cost estimates.

Both however validated the methodology and noticed

- A substantial difference in salary levels
- A difference in opinion and culture concerning contingency

The US review did also analyse the difference between US and European costing

"Manpower is expressed in person-years. This makes it easier to understand the resource requirements, and implicitly acknowledges the expected different labor basis from different collaborators."

Some Statements from the US Review (1)

The R&D associated with TTF (at ~ 250 MeV, a 0.1% scale proof of principle) has provided confidence in the superconducting RF as LC technology.

The TESLA TDR strategy (to initially operate at an energy of about 500 GeV and then to increase the energy to 800 GeV) is in full accordance with the recommendations by ACFA, ECFA, and HEPAP.

TTF must gain additional operational experience at a 23.4 MV/m gradient level.

Some Statements from the US Review (2)

Strategy to reach 800 GeV assumes gradients of 35 MV/m obtained in mass production before the construction of the accelerator start.

Recently, a bare 9 cell RF cavity has been tested CW up to the required 35 MV/m gradient. Complete cryomodules and RF couplers have yet to be operated at this level with beam. Demonstration of this capability is the high priority of the TESLA Collaboration.

There has been little analysis of project risks and contingency in terms of schedule or scope.

There remain areas for continued review or further R&D and investigation. This would be true in any evolving project.

Open Accelerator Issues

Examples:

- **module engineering** - improved flange and interconnect designs, transportability;
- **modulators** - optimization and investigation of alternative technologies, and design of cost effective control and interlock, review of need of backup switch;
- **low level RF systems** - work on the design and prototyping of LLRF systems and frequency reference;

See list of Tom Himel for all projects:

http://www-project.slac.stanford.edu/lc/Project_List/intro.htm

Some Statements from the US Review (3)

Certain conflict between

- the need to move ahead on project activities and decisions,
- getting collaborator participation in the decision processes at an early stage.

It is clearly understood by the TESLA collaboration that many aspects of the project will have to be reconsidered when the project collaboration is formed and new partners join.

We believe that the TESLA proposal is sound and developed to an appropriate level of detail for this stage in the project proposal process.

ECFA/DESY Study III

St. Malo, April 2002

~ 180 participants, 18 from North America, 1 from Asia

A lot of new work on physics, detectors since TDR and Cracow

Next ECFA/DESY workshop in fall, location to be decided (Prag)

Concluding conference/workshop of the ECFA/DESY III study planned for spring 2003

In view of the International Consensus and the International Steering Group a continuation of this workshop beyond 2003 is envisaged.

- (CALEIDO):

- Vertex Detector R&D: (CCD, CMOS technologies)

CCD readout chip mask

- Main Tracking Detector (TPC) R&D:

Formal review procedure provided by DESY PRC

How to Realise Big Accelerator Projects?

Global Accelerator Network

- Collaboration of interested accelerator laboratories and institutes world-wide with the goal to build, operate and utilise large new accelerators
- Follows major detector collaboration in particle physics
- Partners contribute **in full responsibility** through components or subsystems
- Facility is common property
- Responsibility, cost are shared
- Remote operation
- Project of limited duration (~ 25 years)

Important to work out the detailed management issues

**Workshop on
Enabling the Global Accelerator Network**
www.lns.cornell.edu/ganwkshp/

Announcing the first of two workshops examining the implications of a Control System for an internationally designed, constructed, and operated frontier accelerator.

WORKING GROUPS:

- Elements of Global Control
- Tools for Implementing Control Systems
- Communication and Community Building

**March 21-23, 2002
at
Cornell University,
Ithaca, New York, USA**

To promote focused discussion, attendance will be limited to 40, first come, first served.

**INTERNATIONAL
ADVISORY COMMITTEE**

A. Arthur (TUM)	J. Sjoen (SLAC)
M. Barlett (LBNL)	A. Srinivas (TIFR)
J. Bolger (SLAC)	M. Spink (SLAC)
S. Holmes (FNAL)	M. Tigner (Cornell)
S. Knapke (DESY)	A. Wigg (DESY)
S. Durr (BNL)	H. Wulfsberg (ZERN)

PROGRAM COMMITTEE

b. Auer (LBNL)	S. Hult (DESY)
P. Burt (U. Florida)	S. Hult (DESY)
R. Burt (DESY)	E. Hult (FNAL)

or
GAN WORKSHOP 2002
180 Newman Laboratory
Cornell University
Ithaca, New York 14853

GAN

Remote operation will very likely be of key importance for the future operation of large facilities.

Key issues:

- social aspects
- identify exciting issues, challenges

Tests in this area are ongoing or planned (TTF, A0, LINX, PI 3...)

The GAN workshop was an important start for an in-depth study of the critical issues and for real experiments

Remote Control for Experiments

Likely scenario for accelerator control:

Have several control rooms around the globe

Suggestions:

- Adapt model of several control rooms also for control room(s) of experiment(s)
- Combine them with the accelerator control rooms at the same locations

Advantage:

Close interaction between experimenters and machine operators

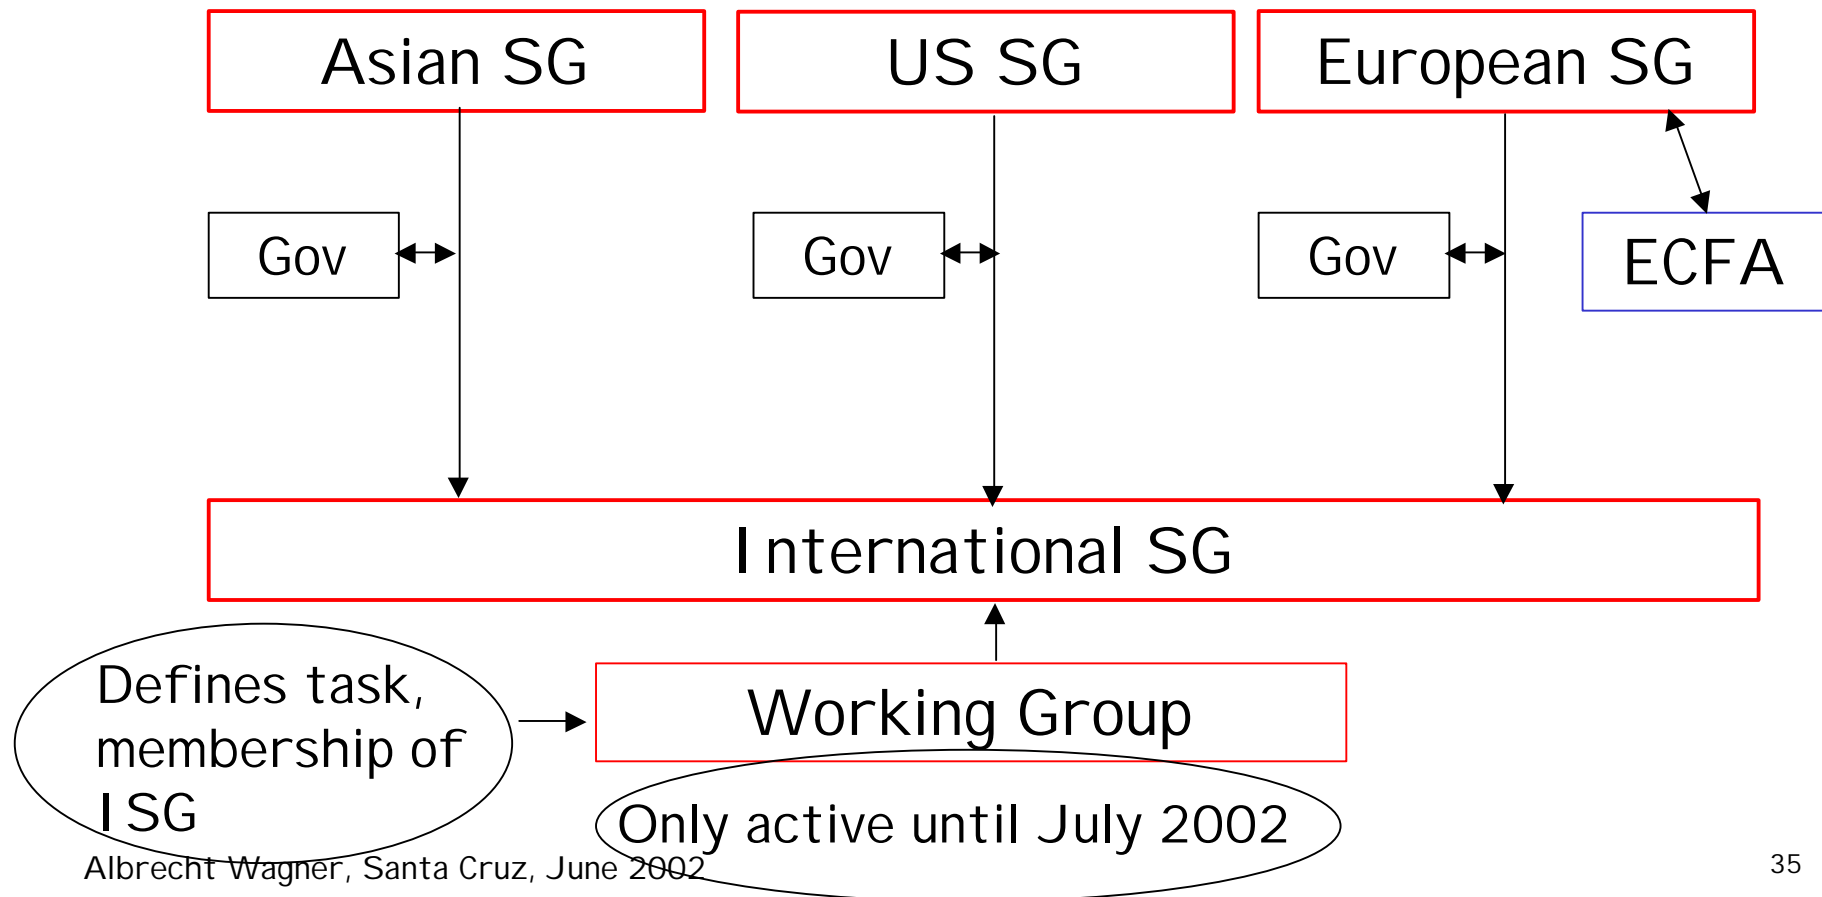

Visible presence of experiment(s) in the regions

Of course a certain **on-site shift crew** will be also required

LC Steering Groups

I CFA initiative:

Composition of the European Steering Group

RECFA has endorsed the formation of an ESG and its mandate at its May 2002 meeting

The ESG has the following composition:

- ECFA chair ([Brian Foster](#))
- Chair of the ECFA LC physics study group ([David Miller](#))
- One representative of CERN ([Luciano Maiani](#))
- One representative of DESY ([AW](#))
- Two persons representing the other European laboratories active in linear collider work (e.g. in France, Italy, UK) ([F. Richard](#), [S. Bertolucci](#))

The committee will be chaired by the chair of ECFA.

Principal Conclusions Regarding the Road Map:

- The Consultative Group concurs with the world-wide consensus ... that a high-energy electron-positron linear collider is the next facility.
 - There should be a significant period of concurrent running of the LHC and the LC, requiring the LC to start operating before 2015. Given the long lead times for decision-making and for construction, consultations among interested countries should begin at a suitably-chosen time in the near future.
 - The cost of the LC will be broadly comparable to that of the LHC, and can be accommodated if the historical pattern of expenditure on particle physics resources that
- Request by the US representatives to continue the group in one form or the other after summer 2002

The Time Line

We must keep the time line in mind in our next steps:

The synergy between the LHC and the linear collider argues for an **early start**. The linear collider should be ready to **begin construction in 2005**.

Need to **converge** towards one project **soon** to meet challenges

International technical review helps to **clarify issues**, but will not provide a recommendation

What can we do to be able to **begin construction in 2005**?

Evaluation by German
Science Council

Context: Large Scientific infrastructure proposals

Working Groups have been established, started to work:

- TESLA Linear Collider
- Free Electron Lasers
- etc.

Final evaluation/recommendation by fall 2002

Decision by German government expected in 2003

Oral Briefing by Science Council after Site Visit

TESLA Linear Collider:

The LC answers key questions, is complementary to LHC, is next accelerator to be built

The technical preparation is excellent, TTF is impressive and a great engineering achievement. TTF is not only a test of components but of a system.

Recommendation: 35 MV/m should have highest priority

Strong support for concept for international realisation

TESLA X-FEL:

Scientific potential excellent.

Impressed by technical preparation and results

The Next Steps

Continue to convince all interested **governments** to **invest in a joint international project**, e.g. through the mechanism of a **Global Accelerator Network** or alike.

The **choice of site will be primarily a political decision**, determined by which country/region is willing to host the facility. The host has to make a major investment and a long term commitment.

The **political decision** might speed up the **technology choice**.

Conclusion

The particle physics case for a LC is compelling and timely

Unique capabilities and complementary to LHC, being now analysed in much more detail

X-FEL will provide 0.1 nm light with very high peak brilliance

Many fields of science will greatly benefit

Superconducting technology provides excellent experimental conditions and is mature and cost effective

Scientific recommendation on LC and XFEL in 2002

Political decision expected in 2003

A Last Word

Need to make progress on
international collaboration
to meet
the technical challenge and the time line
