To receive full credit, you must exhibit the intermediate steps that lead you to your final results.

5. Boas, p. 559, problem 11.12–12. To obtain the numerical value of this integral, either use some appropriate mathematical software, or employ the appropriate expansion obtained in problem 4 above.

7. In class, we showed that the volume $V_n$ of an $n$-dimensional hypersphere with radius $R = 1$ is given by
   \[ V_n = \frac{\pi^{n/2}}{\Gamma\left(\frac{n}{2} + 1\right)}. \]
   We remarked that as a function of increasing $n$, $V_n$ first increases and then decreases, approaching zero as $n \to \infty$.

   (a) Using Stirling’s approximation for the gamma function, prove the assertion that $\lim_{n \to \infty} V_n = 0$.

   (b) Using Stirling’s approximation for the logarithm of the gamma function, compute the value of $n$ at which $V_n$ is a maximum. [HINT: First, estimate the location of the maximum of $\ln(V_n)$ by evaluating the derivative of $\ln(V_n)$ with respect to $n$ and setting the derivative equal to zero. (In computing the derivative, you may neglect at first approximation any term that vanishes for large $n$.) Argue that your result also provides the approximate value of $n$ for which $V_n$ is a maximum.]
Compute $V_n$ for values of integer $n$ near its maximum and determine which integer $n$ corresponds to the largest value of $V_n$. Compare your result with part (b) and comment. For those of you who are more ambitious, use a calculator or a computer algebraic system (e.g. Mathematica or Maple) to determine the actual (non-integer) value of $n$ for which $V_n$ is maximal.

8. The logarithmic derivative of the gamma function is defined by

$$\psi(x) \equiv \frac{d}{dx} \ln \Gamma(x) = \frac{\Gamma'(x)}{\Gamma(x)}.$$ 

(a) Starting from $\Gamma(x + 1) = x\Gamma(x)$, take two derivatives and show that

$$\psi'(x + 1) = -\frac{1}{x^2} + \psi'(x), \quad (1)$$

where $\psi'(x)$ denotes the derivative of $\psi(x)$ with respect to $x$.

(b) Use the result of part (a) to show that for any non-negative integer $n$,

$$\psi'(n + 1) = \psi'(1) - \sum_{k=1}^{n} \frac{1}{k^2}. \quad (2)$$

HINT: Use eq. (1) repeatedly for $x = 1, 2, \ldots, n$.

(c) Starting with Stirling’s approximation for $\ln \Gamma(x + 1)$, prove that

$$\lim_{n \to \infty} \psi'(n + 1) = 0.$$ 

(d) Taking the $n \to \infty$ limit of eq. (2), compute $\psi'(1)$ and $\Gamma''(1)$, where $\Gamma''(1)$ is the second derivative of the gamma function $\Gamma(x)$ evaluated at $x = 1$.

9. In class, we derived the leading term of the asymptotic expansion of $\Gamma(x + 1)$, which is valid for $x \to \infty$. In this problem, you will compute the first correction to Stirling’s formula as follows. Starting with

$$\Gamma(1 + x) = \int_0^\infty e^{x\ln t - t} dt,$$

one can expand the argument of the exponent in a Taylor series about $t = x$. We will need to keep four terms in this series:

$$x \ln t - t \simeq x \ln x - x - \frac{(t - x)^2}{2x} + \frac{(t - x)^3}{3x^2} - \frac{(t - x)^4}{4x^3}.$$ 

(a) Inserting this expansion into the integral above, and changing the integration variable to

$$u \equiv \frac{t - x}{\sqrt{2x}},$$
show that
\[
\Gamma(1 + x) \simeq \sqrt{2xe^{\ln x - x}} \int_{-\infty}^{\infty} du \exp \left( -u^2 + \frac{2\sqrt{2u^3}}{3\sqrt{x}} - \frac{u^4}{x} \right).
\]

(b) Since \(x\) is assumed to be large, we can replace the lower limit of the integral by \(-\infty\) (the resulting error in making this approximation is exponentially small). Moreover, the integrand can be approximated in the limit of large \(x\) to be of the form:
\[
\exp \left( -u^2 + \frac{2\sqrt{2u^3}}{3\sqrt{x}} - \frac{u^4}{x} \right) = e^{-u^2} \exp \left( \frac{2\sqrt{2u^3}}{3\sqrt{x}} - \frac{u^4}{x} \right) \simeq e^{-u^2} \left[ 1 + \frac{A(u)}{\sqrt{x}} + \frac{B(u)}{x} \right],
\]
where \(A(u)\) and \(B(u)\) are simple \(u\)-dependent polynomials that arise from the expansion of the second exponential function above. Determine the explicit forms for \(A(u)\) and \(B(u)\).

(c) Using the results for \(A(u)\) and \(B(u)\) obtained in part (b), complete the analysis by computing the integral over \(u\):
\[
\Gamma(1 + x) \simeq \sqrt{2xe^{\ln x - x}} \int_{-\infty}^{\infty} du e^{-u^2} \left[ 1 + \frac{A(u)}{\sqrt{x}} + \frac{B(u)}{x} \right]. \quad (3)
\]
Show that the final result is of the form:
\[
\Gamma(x + 1) \simeq \sqrt{2\pi xe^{-x}x^x} \left[ 1 + \frac{C}{x} \right],
\]
where \(C\) is determined from your computation of the integral in eq. (3).

\textit{HINT}: The integrals that you need to evaluate in part (c) are very simply related to the integrals of problem 2 of homework set #4.
