

Lorentz invariants (scalars)

$$F^{\mu\nu} F_{\mu\nu} = 2(\vec{E}^2 - \vec{B}^2)$$

$$F^{\mu\nu} \tilde{F}_{\mu\nu} = -4 \vec{E} \cdot \vec{B}$$

where

$$\tilde{F}^{\mu\nu} = \frac{1}{2} \epsilon^{\mu\nu\alpha\beta} F_{\alpha\beta}$$

which means that

$$\vec{E}'^2 - \vec{B}'^2 = \vec{E}^2 - \vec{B}^2$$

$$\vec{E}' \cdot \vec{B}' = \vec{E} \cdot \vec{B}$$

remark:

$$\tilde{F}^{\mu\nu} \tilde{F}_{\mu\nu} = -F^{\mu\nu} F_{\mu\nu}$$

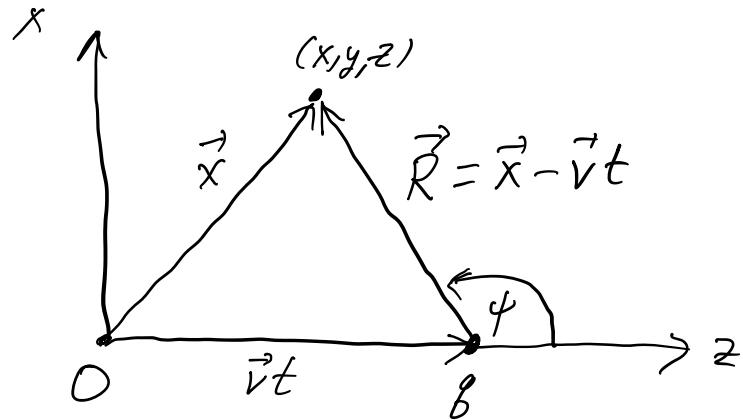

Application: The electromagnetic fields of a uniformly moving charge

Reference frame

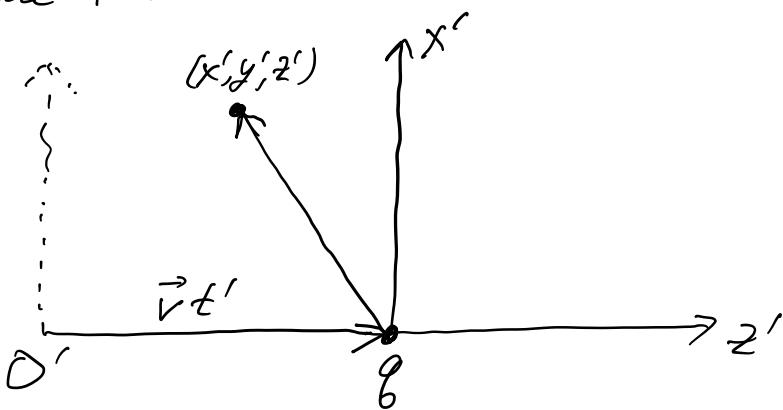

K (lab frame) - observe a charge moving with velocity $\vec{v} = \vec{\beta}c$

K' (rest frame of the charge z)

Reference frame K $(\vec{v} = v \hat{z})$

Reference frame K'

Note: at $t=t'=0$, the origins of K, K' coincide.

$$\text{In } K', \quad \vec{E}' = \frac{\gamma \vec{x}'}{r'^3}, \quad \vec{B}' = 0$$

$$r' = |\vec{x}'|$$

$$\begin{aligned} \text{In } K, \quad \vec{E}_\perp &= \gamma (\vec{E}'_\perp - \vec{\beta} \times \vec{B}'_\perp), & \vec{E}_{||} &= \vec{E}'_{||} \\ & \quad \vec{B}_\perp = \gamma (\vec{B}'_\perp + \vec{\beta} \times \vec{E}'_\perp), & \vec{B}_{||} &= \vec{B}'_{||} \end{aligned}$$

We know that

$$\vec{E}'_{||} = \frac{\gamma \vec{x}_{||}'}{r'^3}, \quad \vec{E}'_{\perp} = \frac{\gamma \vec{x}_{\perp}'}{r'^3}$$

$$\vec{E} = \vec{E}'_{||} + \vec{E}'_{\perp} = \vec{E}'_{||} + \gamma \vec{E}'_{\perp} = \frac{\gamma}{r'^3} (\vec{x}_{||}' + \gamma \vec{x}_{\perp}')$$

$$\vec{B} = \vec{B}'_{||} + \vec{B}'_{\perp} = \gamma \vec{\beta} \times \vec{E}'_{\perp} = \frac{\gamma \beta}{r'^3} \vec{\beta} \times \vec{x}_{\perp}'$$

\Rightarrow

$$\vec{E} = \frac{\gamma \beta}{r'^3} (\vec{x}_{||} - \vec{v} t + \vec{x}_{\perp})$$

$$\vec{B} = \frac{\gamma \beta}{c r'^3} \vec{v} \times \vec{x}_{\perp}$$

$$r'^2 = \gamma^2 (\vec{x}_{||} - \vec{v} t) \cdot (\vec{x}_{||} - \vec{v} t) + \vec{x}_{\perp} \cdot \vec{x}_{\perp}$$

$$= \gamma^2 R_{||}^2 + R_{\perp}^2$$

$$\text{where } \vec{R}_{||} = \vec{x}_{||} - \vec{v} t, \quad \vec{R}_{\perp} = \vec{x}_{\perp}$$

$$\vec{E} = \frac{\gamma \beta \vec{R}}{(\gamma^2 R_{||}^2 + R_{\perp}^2)^{3/2}}, \quad \vec{B} = \frac{\gamma \beta \vec{v} \times \vec{R}}{c(\gamma^2 R_{||}^2 + R_{\perp}^2)^{3/2}}$$

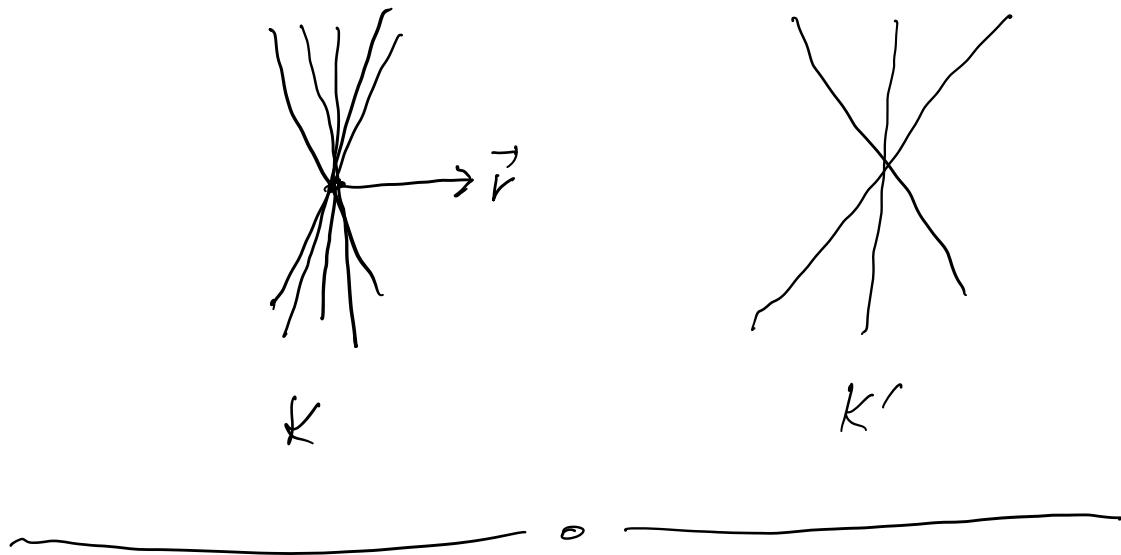

Note

$$\begin{aligned} (\gamma^2 R_{||}^2 + R_{\perp}^2)^{3/2} &= \gamma^3 (R_{||}^2 + R_{\perp}^2 (1 - \beta^2))^{3/2} \\ &= \gamma^3 R^3 (1 - \beta^2 \sin^2 \theta)^{3/2} \end{aligned}$$

since $R_\perp = R \sin \psi$. Thus

$$\vec{E}(\vec{x}) = \frac{q \vec{R}}{\gamma^2 R^3 (1 - \beta^2 \sin^2 \psi)^{3/2}}$$

$$\vec{B}(\vec{x}) = \frac{q \vec{v} \times \vec{R}}{c \gamma^2 R^3 (1 - \beta^2 \sin^2 \psi)^{3/2}}$$

Electromagnetic Radiation

In the Lorenz gauge

$$\square \vec{A} = \frac{4\pi}{c} \vec{J}$$

$$\square = \frac{1}{c^2} \frac{\partial^2}{\partial t^2} - \vec{\nabla}^2$$

$$\square \vec{\phi} = 4\pi \rho$$

$$\square A^\mu = \frac{4\pi}{c} J^\mu$$

Let us examine

$$\square \psi(\vec{x}, t) = 4\pi f(\vec{x}, t)$$

General solution

$$\psi(\vec{x}, t) = \psi_0(\vec{x}, t) + \psi_1(\vec{x}, t)$$

where

$$\square \psi_0(\vec{x}, t) = 0$$

ψ_0 is fixed by initial conditions

But, ψ_1 is not unique

$$\text{Roughly, } \psi(\vec{x}, t) = 4\pi \square^{-1} f(\vec{x}, t)$$

Note that \square has a nontrivial eigenfunction with zero eigenvalue.

$$\text{If } A\psi = 0 \quad \det A = \prod_i \lambda_i = 0$$

A^{-1} does not exist.

$$A\psi = f \Rightarrow$$

solution ψ either does not exist or exists but is not unique.

We will see that the solution to the inhomogeneous equation, $\psi_i(\vec{x}, t)$ is non-unique.

$\psi_i(\vec{x}, t)$ will be determined by imposing a physical condition : causality.

Green function technique

$$\square_x G(x, x') = 4\pi \delta^4(x - x')$$

$$\delta^4(x - x') = \delta^3(\vec{x} - \vec{x}') \delta(x_0 - x'_0) \quad x_0 = ct$$

By translational invariance, $G(x, x') = G(x - x')$

Sufficient to solve

$$\square G(x) = 4\pi \delta^4(x)$$

Once you know $G(x)$, then

$$\psi_i(x) = \int d^4x' G(x - x') f(x')$$

because

$$\square \psi_i(x) = 4\pi \int d^4x' \delta^4(x - x') f(x') = 4\pi f(x)$$

Method of solution : Fourier transform

(converts a differential equation into
an algebraic equation)

$$G(x) = \frac{1}{(2\pi)^4} \int d^4k \tilde{G}(k) e^{-ik \cdot x}$$

$$(k \cdot x = k_0 x_0 - \vec{k} \cdot \vec{x})$$

$$\delta^4(x) = \frac{1}{(2\pi)^4} \int d^4x e^{-ik \cdot x}$$

Plug these into $\square G(x) = 4\pi \delta^4(x)$

$$\Rightarrow -k^2 \tilde{G}(k) = 4\pi$$

$$\tilde{G}(k) = -\frac{4\pi}{k^2}, \quad k^2 = k_0^2 - |\vec{k}|^2$$

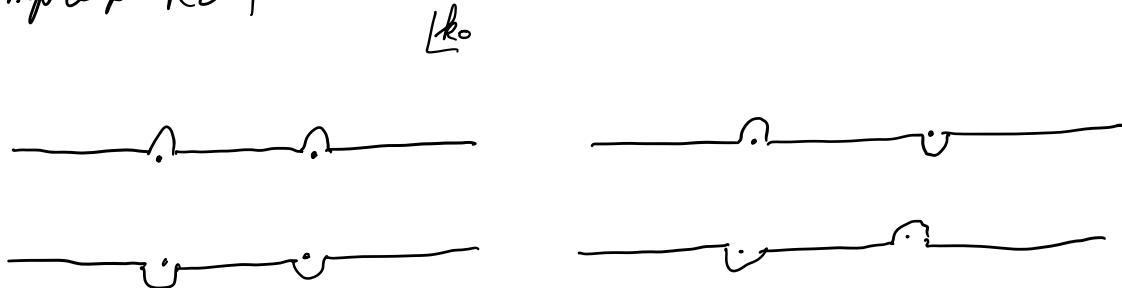

$$\begin{aligned} G(x) &= -\frac{4\pi}{(2\pi)^4} \int \frac{d^4k}{k^2} e^{-ik \cdot x} \\ &= -\frac{1}{4\pi^3} \int d^3k e^{i\vec{k} \cdot \vec{x}} \int_{-\infty}^{\infty} dk_0 \frac{e^{-ik_0 x_0}}{k_0^2 - |\vec{k}|^2} \end{aligned}$$

Problem!! singularity at $k_0 = \pm(\vec{k})$
 \Rightarrow integral over k_0 does not exist!

Even though \square^{-1} does not exist, we need a strategy to solve $\square \psi = 4\pi f$
[or to solve $\square G = 4\pi \delta^4(x)$]

Strategy: deform the integration over k_0 (infinitesimal deformation) so that integral is well-defined.

Deform the contour by an excursion into the complex k_0 plane

Impose causality \Rightarrow

"chooses"

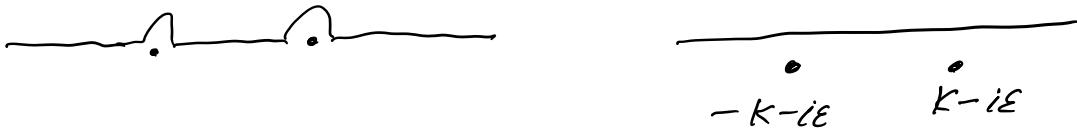

$$G_R(x, t) = 0 \quad \text{if } t < 0 \quad R = \text{"retarded"}$$

Equivalently

$$G_R(x) = -\frac{1}{4\pi^3} \int d^3k e^{ik \cdot \vec{x}} \int_{-\infty}^{\infty} dk_0 \frac{e^{-ik_0 x_0}}{(k_0 - K + i\epsilon)(k_0 + K + i\epsilon)}$$

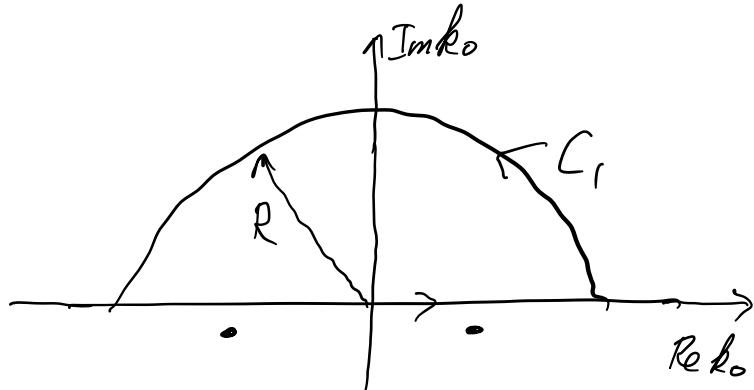

where $K \equiv |\vec{k}|$. $\epsilon > 0$ infinitesimal

poles appear at $k_0 = \pm K - i\epsilon$ ($\text{Im } k_0 < 0$)

1. Suppose $x_0 = t < 0$

$$|x_0| = -x_0$$

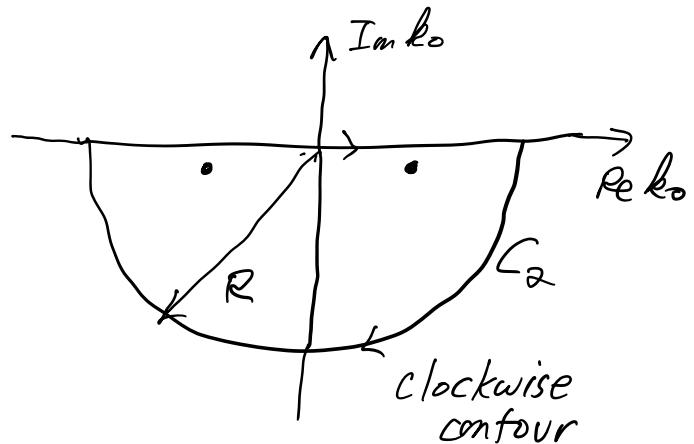

Hence,

$$G_R(x) = 0 \quad \text{if } t < 0$$

2. Suppose $x_0 = t > 0$

Close contour in lower half k_0 plane.

$$|k_0| = x_0$$

$$\int_{C_2} dk_0 \frac{e^{-ik_0 |x_0|}}{(k_0 - k + i\epsilon)(k_0 + k + i\epsilon)}$$

$$= \frac{-2\pi i}{2K} \left[e^{-iKx_0} - e^{iKx_0} \right] \quad \text{after taking } \epsilon \rightarrow 0$$

$$= -\frac{2\pi}{K} \sin(Kx_0)$$

Hence,

$$G_R(x) = \frac{1}{2\pi^2} \Theta(x_0) \int d^3k e^{i\vec{k} \cdot \vec{x}} \frac{\sin Kx_0}{K}$$

$$= \frac{1}{\pi} \Theta(x_0) \int_0^\infty K dK \sin Kx_0 \int_{-1}^1 d\cos \theta e^{iK|\vec{x}| \cos \theta}$$

$$\text{where } d^3k = k^2 dK d\cos \theta d\phi$$

$$\begin{aligned}
G_R(x) &= \frac{1}{\pi} \Theta(x_0) \int_0^{\infty} K dK \sin Kx_0 \frac{1}{e^{iK|\vec{x}|}} [e^{iK|\vec{x}|} - e^{-iK|\vec{x}|}] \\
&= \frac{2}{\pi r} \Theta(x_0) \int_0^{\infty} dK \sin Kx_0 \sin Kr \\
&\quad r = |\vec{x}| \\
&= \frac{\Theta(x_0)}{2\pi r} \int_{-\infty}^{\infty} dk [e^{i(x_0-r)k} - e^{i(x_0+r)k}] \\
&= \frac{\Theta(x_0)}{r} [\delta(x_0-r) + \delta(x_0+r)] \\
&= \frac{\Theta(x_0)}{r} \delta(x_0-r)
\end{aligned}$$

Thus,

$$G_R(x) = \frac{\Theta(x_0) \delta(x_0 - |\vec{x}|)}{|\vec{x}|}$$

You don't need the $\Theta(x_0)$, since $\delta(x_0 - |\vec{x}|) = 0$ if $x_0 < 0$.

$$\Theta(x_0) = \begin{cases} 1, & x_0 > 0 \\ 0, & x_0 \leq 0 \end{cases}$$

Last time, we outlined a method to solve

$$\square \Psi(\vec{x}, t) = 4\pi f(\vec{x}, t).$$

The solution to this inhomogeneous wave equation is

$$\Psi(\vec{x}, t) = \Psi_0(\vec{x}, t) + \Psi_1(\vec{x}, t)$$

where

$$\square \Psi_0(\vec{x}, t) = 0 \quad \text{"particular solution"}$$

and

$$\Psi_1(x) = \int_R d^4x' G_R(x-x') f(x')$$

where $x \equiv (ct; \vec{x})$ and

$$\square_x G_R(x, x') = 4\pi \delta^4(x-x')$$

Imposing causality, i.e. $G_R(x, t) = 0$ if $t < 0$,

where $G_R(x, x') = G_R(x-x')$, we found that

$$G_R(x) = \frac{\delta(x_0 - |\vec{x}|)}{|\vec{x}|} \quad \begin{matrix} \text{retarded} \\ \text{Green function} \end{matrix}$$

Hence,

$$\Psi_1(x) = \int d^3x' \int_{-\infty}^{\infty} dx'_0 \frac{\delta(x_0 - x'_0 - |\vec{x} - \vec{x}'|)}{|\vec{x} - \vec{x}'|} f(\vec{x}', t') \quad (x'_0 = ct')$$

$$= \int \frac{d^3x'}{|\vec{x} - \vec{x}'|} f(x', t' = t - \frac{|\vec{x} - \vec{x}'|}{c})$$

Definition: (t' is the "retarded time")

$$[f(\vec{x}', t')]_{\text{ret}} \equiv f(\vec{x}', t' = t - \frac{|\vec{x} - \vec{x}'|}{c})$$

$$\boxed{\Psi(x) = \int d^3x' \frac{[f(x, t')]_{\text{ret}}}{|\vec{x} - \vec{x}'|}}$$

$$t' = t - \frac{|\vec{x} - \vec{x}'|}{c}$$

For electromagnetic waves, (Lorenz gauge)

$$\square A^\mu = \frac{4\pi}{c} J^\mu \quad J^\mu(cg; \vec{J})$$

$$\vec{A}(\vec{x}, t) = \frac{1}{c} \int d^3x' \frac{[\vec{J}(\vec{x}', t')]_{\text{ret}}}{|\vec{x} - \vec{x}'|}$$

$$\vec{\Phi}(\vec{x}, t) = \int d^3x' \frac{[\rho(\vec{x}', t')]_{\text{ret}}}{|\vec{x} - \vec{x}'|}$$

$$\vec{E} = -\vec{\nabla} \vec{\Phi} - \frac{1}{c} \frac{\partial \vec{A}}{\partial t} \quad (\text{in cgs units})$$

$$\vec{B} = \vec{\nabla} \times \vec{A}$$

$$\text{Since } A^\mu = (\vec{\Phi}; \vec{A})$$

$$\square \vec{E} = -4\pi \left(\vec{\nabla} \rho + \frac{1}{c^2} \frac{\partial \vec{J}}{\partial t} \right)$$

$$\square \vec{B} = \frac{4\pi}{c} \vec{\nabla} \times \vec{J}$$

Hence,

$$\vec{E}(\vec{x}, t) = - \int \frac{d^3x'}{| \vec{x} - \vec{x}' |} \left[\vec{\nabla}' \rho + \frac{1}{c^2} \frac{\partial \vec{J}}{\partial t'} \right]_{\text{ret}}$$

$$\vec{B}(\vec{x}, t) = \frac{1}{c} \int \frac{d^3x'}{| \vec{x} - \vec{x}' |} \left[\vec{\nabla}' \times \vec{J} \right]_{\text{ret}}$$

Note:

$$[f(\vec{x}', t')]_{\text{ret}} = f(\vec{x}', t - \frac{|\vec{x} - \vec{x}'|}{c})$$

In particular,

$$\vec{\nabla}' [f]_{\text{ret}} \neq [\vec{\nabla}' f]_{\text{ret}}$$

\uparrow \uparrow
fixed t fix t'

(and \vec{x} is fixed).

Use the chain rule!
