1. Consider the set $\mathbb{R}^2$ consisting of pairs of real numbers. For $(x, y) \in \mathbb{R}^2$, define scalar multiplication by: $c(x, y) = (cx, cy)$ for any real number $c$, and define vector addition and multiplication as follows:

$$(x_1, y_1) + (x_2, y_2) = (x_1 + x_2, y_1 + y_2),$$

$$(x_1, y_1) \cdot (x_2, y_2) = (x_1x_2, y_1y_2).$$

(a) Is $\mathbb{R}^2$ a group?
(b) Is $\mathbb{R}^2$ a field?
(c) Is $\mathbb{R}^2$ a linear vector space (over $\mathbb{R}$)?
(d) Is $\mathbb{R}^2$ a linear algebra (over $\mathbb{R}$)?

2. Consider the following two groups:

$$T = \{\text{proper rotations that map a regular tetrahedron into itself}\},$$

$$T_d = \{\text{proper rotations and reflections that map a regular tetrahedron into itself}\}.$$

Show that the following isomorphisms are valid: $T \cong A_4$ and $T_d \cong S_4$.

3. Consider the possibility that a set $G$ of $n \times n$ matrices forms a group with respect to matrix multiplication.

(a) Prove that if $G$ is a group and if one of the elements of $G$ is a non-singular matrix then all of the elements of $G$ must be non-singular matrices. Conclude that all the elements of $G$ are either non-singular matrices or singular matrices.

(b) Consider the set of $2 \times 2$ singular matrices $G$ of the form

$$\begin{pmatrix} x & x \\ x & x \end{pmatrix},$$

where $x \in \mathbb{R}$ and $x \neq 0$. Prove that $G$ is a group with respect to matrix multiplication. Determine the matrix corresponding to the identity element of $G$. Determine the inverse of the element specified in eq. (1).

(c) The group defined in part (b) is isomorphic to a well known group. Identify this group.
4. Consider the dihedral group $D_4$.
   (a) Write down the group multiplication table.
   (b) Enumerate the subgroups, the normal subgroups and the conjugacy classes.
   (c) Identify the factor groups. Is the full group the direct product of some of its subgroups?
   (d) Write out the conjugacy class multiplication table.
   (e) Determine explicitly the matrices of the regular representation.

5. The center of a group $G$, denoted by $Z(G)$, is defined as the set of elements $z \in G$ that commute with all elements of the group. That is,
   $$Z(G) = \{ z \in G \mid zg = gz , \forall g \in G \} .$$
   (a) Show that $Z(G)$ is an abelian subgroup of $G$.
   (b) Show that $Z(G)$ is a normal subgroup of $G$.
   (c) Find the center of $D_4$ and construct the group $D_4/Z(D_4)$. Determine whether the isomorphism $D_4 \cong [D_4/Z(D_4)] \otimes Z(D_4)$ is valid.

6. Consider an arbitrary orthogonal matrix $R$, which satisfies $RR^T = I$ (where $I$ is the identity matrix).
   (a) Prove that the possible values of det $R$ are $\pm 1$. [HINT: Consider det$(RR^T)$ and use one of the well-known properties of determinants.]
   (b) The group SO(2) consists of all $2 \times 2$ orthogonal matrices with unit determinant. Prove that SO(2) is an abelian group.
   (c) The group O(2) consists of all $2 \times 2$ orthogonal matrices, with no restriction on the sign of its determinant. Is O(2) abelian or non-abelian? (If the latter, exhibit two O(2) matrices that do not commute.)
